

**The** *Natural Gas Engine-Driven Air Compressor Advisor* is an analysis and reference tool intended to help with evaluation and selection of gas-powered air compressors. This *Advisor* is targeted for industrial applications, and covers air compressors in the approximate size range of 50 to 500 horsepower.

The *Air Compressor Advisor* was developed by Energy International under the guidance of the Industrial Center Air Compressor Consortium. Consortium participation has helped ensure that essential calculations are computed accurately by this powerful, yet easy-to-use, economic decision analysis tool. Results have been validated against several real-world examples.

The *Air Compressor Advisor* is organized into three sections: Manufacturers, Case Studies, and Economic Calculations. The Manufacturers section contains a database of company listings and product offerings (color photographs of products are included when available). The user has the ability to customize this database by adding, deleting, or modifying entries.

The Case Studies section contains several examples of sites that have benefited from the installation of gas engine-driven air compressors. Like the Manufacturers section, the user can customize the database by modifying, adding, or deleting information.

The Economic Calculations section is comprised of two calculators: Quick Economics and Detailed Economics. The Quick Economics calculator allows the user to perform a quick screening to compare engine-driven and electric motor-driven air compressors. The Detailed Economics calculator allows the user to perform a thorough site-specific analysis by setting variables such as: time of operation, part load efficiency, detailed gas and electric rates, capital or lease purchase criteria, and capital and maintenance costs.
